Dataset Description

Overview

The data pertains to the houses found in a given California district and some summary stats about them based on the 1990 census data, including median income, house age, number of rooms, population, and median house value.

Features

The dataset contains 10 numerical features but only 2 features were selected.

Axis	Feature	Description
X-axis	**median_income**	Median income for households within a block of houses (measured in tens of thousands of US Dollars)
Y-axis	**median_house_value**	Median house value for households within a block (measured in US Dollars)

The model will learn the relationship between median income and median house value and predict house values based on income.
